Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Introduction

Rationale and Purpose

The 1996 Amendments to the Federal Safe Drinking Water Act (SDWA) introduced a new approach for ensuring clean and safe drinking water served by public water suppliers in the United States. Building upon the past strengths of the Surface Water Treatment Rule, increases in water monitoring and other compliance measures, the U.S. Environmental Protection Agency (USEPA) and the Georgia Environmental Protection Division (GAEPD) are now advocating prevention as an important tool in the protection of public water suppliers from contamination and source protection. In order to implement prevention and protection, an assessment of potential pollution sources must first be conducted.

Georgia's Source Water Assessment Plan (SWAP) has a specific focus on water supply source protection and sharing like goals with other water quality protection and enhancement programs (e.g. GAEPD River Basin Management Planning and Nonpoint Source programs). These programs seek to prevent and control impairments to water quality as well as abate contamination sources currently impacting uses. With these programs sharing similar goals, care should be taken to integrate the activities of SWAP so that its implementation can compliment other water quality protection and enhancement programs.

Limitations

This report was prepared to assess threats to Haralson County's public water supply. It is based on published information and information obtained from local residents and stakeholders familiar with the assessment area. Not all potential or existing sources of groundwater or surface water contamination in the Bush Creek area are identified. Only sources of contamination in the catchment area of the surface water intake are considered potential contamination sources. The catchment area is the land area to which atmospheric precipitation falls upon and flows downward to the intake structure.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Source Water Assessment Plan Funding

By the "Safe Drinking Water Act (SDWA) Amendments of 1996", Public L. 104-182, and amending title XIV of the Public Health Service Act, Congress has empowered the United States Environmental Protection Agency (EPA) to make capitalization grants to assist in establishing a drinking water state revolving fund (DWSRF) for assistance to public water systems in financing the cost of infrastructure needed to achieve or maintain compliance with SDWA requirements and to protect public health. Section 1452 of the SDWA authorizes States to provide funding for certain non-project activities, called Set-Asides, from the DWSRF for capacity development and source water assessment and protection for public water systems at the local government level. This funding will also assist EPD in compliance with the requirements of the Safe Drinking Water Amendments of 1996. EPD has appropriated funds for source water assessments to assist local governments through contracts to coordinate and facilitate the implementation of the State's Source Water Assessment and Protection Plan.

The Source Water Assessment carried out in accordance with the Georgia's Source Water Assessment and Protection Plan was funded by a grant of \$120,000 to the City of Villa Rica from the Georgia Environmental Facilities Authority (GEFA)

Public Participation

The 1996 SDWA Amendments place a strong emphasis on public awareness and involvement. It is required that the public be involved in the development of this Source Water Assessment Program and that the assessment results be made available to the public. The involvement of public interest groups, business groups, local governments conservation groups, water suppliers, and others is encouraged. Many news releases were distributed via print and broadcast media to reach the largest geographic area and to inform the general public about the Source Water Assessment Program and it's development.

A technical advisory committee/task force has been established to provide input in the development of this source water assessment plan. Groups that were invited to participate on the committee are

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

listed in Appendixes 1-5. Two (2) public meetings were held prior to development of the Source Water Assessment Plan. The purpose of these meetings was to present the proposed plan to the general public.

Background

The Community

The water source intake for Haralson County (WSID #1430000) is located Bush Creek. Bush Creek is a tributary of the Tallapoosa River located northwest of the City of Bremen.

Source Delineation

Introduction

The first technical step in the Source Water Assessment Plan is to conduct the delineation of the source waters. This includes identifying the locations of the source water intake points on a map, delineating the topographic boundary of the watersheds, and delineating any and all municipalities and county borders associated with the watershed.

The entire watershed that drains into a surface drinking water intake is considered the Source Water Protection Area. The USEPA realizes, for the purpose of inventorying potential pollution sources and determining susceptibility, the State can identify smaller areas or segments of watersheds and buffer zones for a cost and time effective analysis. The GAEPD has decided to utilize these smaller assessment areas to identify and inventory the potential pollution sources, determine susceptibility, and possibly initiate protection approaches.

The assessment area methodology is based upon protection distances within the *GAEPD Rules of Environmental Planning Criteria: Criteria for Water Supply Watersheds (391-3-16-01)*. The assessment area delineation is comprised of three management zones: the 7-mile inner management zone, the 20-mile outer management zone, and the non-management zone that extends beyond 20 miles.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Source Water Delineation

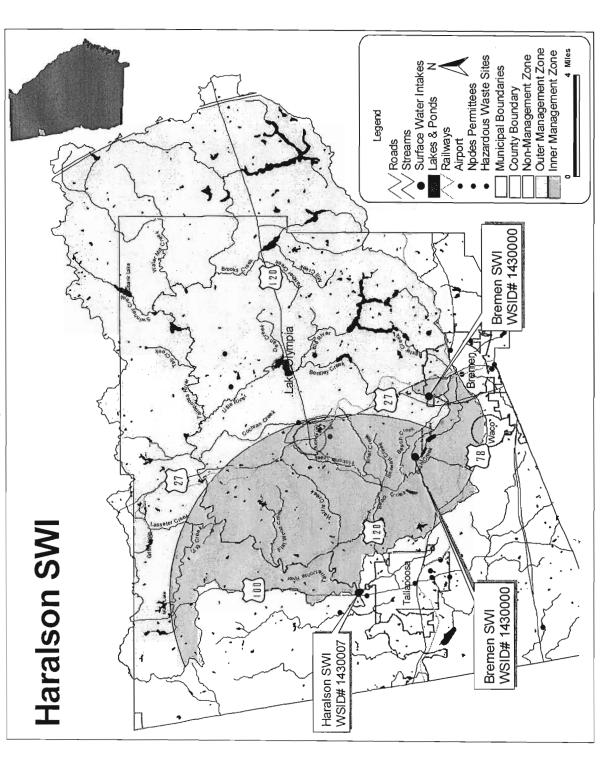

Source water delineation includes identifying the locations of the source water intake points on a map, delineating the topographic boundary of the watersheds, and delineating any and all municipalities and county boundaries associated with the watershed.

The delineation of the watershed for the Haralson County-Bush Creek intake (WSID #1430000) was determined utilizing a combination of geographic information system (GIS) software and geographic (topographic) data supplied by numerous sources to include: the US Geological Survey, the US Bureau of the Census, State Base Maps of Georgia, the Georgia Department of Transportation, the Georgia Department of Industry Trade and Tourism, and the Georgia Department of Natural Resources-Environmental Protection Division (GAEPD).

The catchment area, which is the land area to which atmospheric precipitation falls upon and flows downward to the intake structure, of the Haralson County-Bush Creek intake extends for approximately 5 square miles. The perimeter of the catchment area was based on 1:24,000 scale 12-digit Hydrologic Unit Code (HUC) boundaries produced by the EPD.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000) Source Water Assessment Plan Report

I:\Aprojeng\00004e\documents\SWAP\reports\Haralson County SWAP\Haralson-Bush Creek WSID #1430000 report.doc

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000) Public Water Supply

The Haralson County receives a portion of their water from the intake on Bush Creek (WSID# 1430000). The City of Bremen public water system serves approximately 8,024 residents. Coagulation, flocculation, sedimentation, filtration, and disinfection are used to treat the water.

Water Quality

Potential Contaminant Inventory

An inventory of potential contaminant sources was conducted to assess the susceptibility of Bremen's drinking water source to contamination. Sources of all primary water contaminants and cryptosporidium were identified, however, only potential sources of contaminants that are the greatest threat to human health were selected for detailed inventory. The contaminants of greatest concern to Bowdon are nitrate, microbial contaminants, solvents, and sediment.

The inventory for Haralson County focuses on the facilities that possibly generate, use, or store potential contaminants in the assessment region.

Inventory Method

Available databases were searched to identify businesses and land uses that are potential sources of regulated contaminants in the inventory region. The following steps were followed:

- 1. Airports, confined animal feedlots, oil pipelines, gas pipelines, railways, and roads were downloaded form the Georgia GIS Clearinghouse.
- 2. EPA's Envirofacts System was queried to identify EPA regulated facilities located in the inventory region. This system accessed facilities listed in the following databases: Resource Conservation and Recovery Information System (RCRIS), Biennial Reporting System (BRS), Toxic Release Inventory (TRI), Permit Compliance System (PCS), and Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS).
- An inventory of facilities that possess NPDES permits was obtained from the Georgia Department of Natural Resources Environmental Protection Division (EPD) Water Protection Branch.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

- 4. An inventory of facilities that possess NPDES stormwater permits was obtained from the Georgia GIS Clearinghouse.
- 5. Potential pollution sites were verified and amended through telephone calls, visual sightings, and communal knowledge from members of the advisory and technical committees.

Potential contaminant sources are designated as significant if they are in the surface water catchment area and fall into one of the following categories:

1.	Agricultural Waste Lagoon
2.	Airports
3.	
4.	
	Hazardous Waste Facilities
	LAS Permit Holders
	Landfills
8.	
0.	Chemicals
9.	Large Industries Which Have Bulk Chemical
	and Petroleum Storage
10.	Large Industries Which Have Federal
	Categorical Standards
	Large Quantity Generators
12.	Lift Stations
13.	Marinas
14.	Military Bases
	Mining
16.	NPDES Permit Holders
17.	NPDES Industrial Stormwater
18.	Non-sewer Areas
	Oil Pipelines
20.	Power Plants
21.	Railways Adjacent to or on Bridges Crossing
	over Streams
22.	Roads Adjacent to or Bridges Crossing over
	Streams
	Sewer Areas
	Wastewater Plants
25.	Water plants

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

The following are the references for the databases that were searched for the potential pollution inventory:

Tallapoosa River Basin Management Plan

The Georgia Department of Natural Resources Environmental Protection Division, in cooperation with the USDA Natural Resources and Conservation Commission, Georgia Soil and Water Conservation Commission, Georgia Forestry Commission, the US Geological Survey, and Georgia Wildlife Resources Division, developed and implemented a river basin management planning program to protect, enhance, and restore the waters of the Tallapoosa River Basin, which include the Little Tallapoosa River and its tributaries. The Tallapoosa River Basin Management Plan provide for effective monitoring, allocation, use, regulation, and management of water resources. It also identified existing and future water quality issues, emphasizing nonpoint sources of pollution.

The Georgia 2000 List of Waters

The Georgia 2000 List of Waters is a requirement by Section 303(d) of the Federal Clean Water Act (CWA). The list was developed in accordance with 40 CFR Part 130.7(b)(4) and specific guidance provided by the United States Environmental Protection Agency (USEPA) Office of Water. The Georgia Environmental Protection Division (EPD) has used the "List of Waters" approach since the late 1970s. The lists of waters have been included in the *Water Quality in Georgia* reports submitted to the USEPA in accordance with Section 305(b) of the CWA. Expanded lists including waters partially or not supporting water uses have been included in each Georgia 305(b) Report beginning with the 1982-1983 report. The lists have provided information on parameters violated, causes of the violations, and actions planned to reduce the problems. The lists included point and nonpoint source issues.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000) STORET

(www.epa.gov/storet/)

STORET is EPA's STOrage and RETrieval database system for water quality monitoring data. The states, local governments, and federal agencies, e.g. the US Geological Survey and the Corps of Engineers, have extensively monitored water quality in the Tallapoosa River Basin. Some of this data was available on STORET.

ENVIROFACTS

(http://www.epa.gov/enviro/)

EPA's ENVIROFACTS System was queried to identify EPA regulated facilities located in the Little Tallapoosa River Drainage Basin. This system accesses facilities listed in the following databases: Resource Conservation and Recovery Information System (RCRIS), Biennial Reporting System (BRS), Toxic Release Inventory (TRI), Hazardous Substances Inventory (HSI), and the Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS). The available reports were browsed for facility information including handler/facility classification to be used in assessing whether a facility should be classified as a significant potential contaminant source. The Permit Compliance System (PCS) was queried to identify concentrated animal feeding operations with NPDES permits.

The Department of Natural Resources Environmental Protection Division (EPD) (http://www.dnr.state.ga.us/dnr/environ/)

The State of Georgia GIS Clearinghouse

(http://www.gis.state.ga.us/Clearinghouse/clearinghouse.html)

Inventory Limitations

The potential sources of contaminants for Carrollton's public water supply are identified from data and reports that are readily available. Consequently, unregulated activities or unreported contaminant

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

releases may have been missed. The use of multiple sources of data should ensure that the sources identified represent the major threats to the source water for Carrollton.

Cryptosporidium Sampling

Results

Susceptibility Assessment

The main focus of the susceptibility determination methodology is to determine overall susceptibility of the source water prior to being withdrawn in the drinking water intake. Susceptibility is defined as "the potential for a Public Water System to draw water contaminated by inventoried sources at concentrations that would pose concern." The determination would take into account the "toxicity, environmental fate and transport" of the contaminant and the "location, likelihood of release and effectiveness of mitigation" for the potential pollution sources. This produces a qualitative measure (high, medium, low) that enables those delegated to do assessments and the state to determine easily and quickly the level of susceptibility the surface water intake has to potential pollution sources upstream (EPD Source Water Assessment Implementation Plan, 2000).

The susceptibility determination consists of two main parts: the release potential of a contaminant and the risk the contaminants would be to the surface source water and eventually the surface water intake. Risk is, in the event the contaminant does reach the surface water and the drinking water intake, how great of an impact it will have on the drinking water supply. The combination of the scores from the release potential and risk make up the overall source water susceptibility. The overall source water susceptibility score accounts for the type of water quality that could be present at a drinking water intake prior to being withdrawn into the intake.

Release Potential

The method for determining the release potential include categories for consideration that have weight measures for High, Medium, and Low priority ranking. Depending on the source and/or the contaminant (s), one or more of the following categories may be appropriate for consideration in evaluating the release potential:

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

- Determine the distance from surface water Potential pollution sources within the
 assessment area that are in closer proximity to surface water pose a greater threat to raw
 water quality than do those sources that are further away.
- Estimate the volume of the release Potential pollution sources in the assessment area are not actual pollution sources until an actual release to the environment occurs. The amount of a possible release is estimated using good sound judgment.
- Estimate the duration of the release Sudden releases are usually accidental spills or storm events. Both may pose a threat to the drinking water supply.
- Determine the ease of travel/transport General topography, the presence of defined channels or other considerations that would enhance or mitigate the ease of travel/transport of the potential pollutant to surface water are important considerations. Travel via overland flow and/or possible run-off conveyances to surface water such as drainage ditches, etc. will be much easier than travel through the soil via groundwater.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Release Potential Categories for Surface Source Water

Category	Ranking	
Distance from surface water	High – less than or equal to 500 ft.	
	Low – further than 500 ft.	
Volume of release	High – greater than 10,000 gallons	
	Medium – greater than 1,000 gallons and less than 10,000 gallons	
	Low – less than 1,000 gallons	
Duration of release	High – on-going unpermitted releases, high likelihood of	
	unanticipated one time catastrophic event	
	Medium – on-going, permitted releases, chronic small events,	
	likelihood on continued releases	
	Low – little likelihood of a release, no reported releases	
Ease of Travel/Transport	High – hilly topography, many run-off conveyances, overland flow	
	very likely, few or no structural controls in place	
	Medium – moderate topography or number of run-off conveyances,	
1	overland flow likely, use of some structural controls	
	Low – generally flat topography, travel primarily through soil via	
	groundwater, highly volatile substances that adhere to soils,	
	overland flow not likely and structural controls in place.	

Risk

As with determining release potential, the method for determining the risk to the surface water intake includes different categories for consideration that have weight measures for High, Medium, and Low priority ranking.

Determine the contaminant(s) of concern – Is the contaminant biological, physical, or chemical?

Determine the distance from the surface water intake – Potential pollution sources within the assessment area that are in closer proximity to the surface water intake pose a greater threat to raw water quality than do those sources that are further away.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Determine the toxicity – The more toxic, the higher the risk posed to the drinking water supply and public health.

Risk Categories for Surface Source Water

Category	Ranking
Distance from surface water intake	High – within 7 miles upstream
	Medium – between 7 and 15 miles upstream
	Low – between 15 and 20 miles upstream
Toxicity	High – acute, pathogens
	Medium - chronic, chemicals
	Low – secondary, taste, odor

Along with the general categories listed above, EPD proposes additional guidance to supplement the assessment of two different categories of potential pollutant sources: Regulated Pollutant Sources and Non-Point Sources. Regulated Pollutant Sources include those facilities EPD monitors and regulates. The following table lists the potential and risk guidelines for regulated pollutant sources.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Regulated Pollutant Sources Potential and Risk Guidelines

Point Source	Potential	Risk
_andfills, Dumps <u>High</u> – abandoned/closed landfills,		Based on waste categorization
	history of groundwater contamination	
	Medium – open dumps, inert waste, no	
	groundwater contamination	
	<u>Low</u> – contained landfills, no	
	groundwater contamination, in	
	compliance	
Hazardous Waste Large	High – history of spills, unremediated	Based on type of operation and
Quantity Generators	sites, not following corrective action plan	volume of materials handled
and/or TSD Facilities,	Medium – periodic noncompliance,	
Superfund Sites	partly remediated sites, generators or	
	sites with permits (even in compliance)	
	Low - compliance with regulations, few	
	or no releases, fully remediated sites.	
NPDES Permit Holders,	High – chronic permit violations, waste	Based on regulated pollutants
LAS Permit Holders	lagoons (especially unlined), chronic	
	sewer overflows and/or bypasses	
	Medium – periodic permit violations,	
	moderate number of sewer overflows	× _y
	and/or bypasses	
	Low – compliance with permit	
	conditions, few sewer overflows and/or	
	bypasses	

Non-Point Sources includes potential pollution in runoff from various land uses in the watershed. Susceptibility is determined by the type of land use in the assessment area and if information is available showing use of best management practices or buffer zones. The following is a list of non-point source guidelines.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

Non-Point Source Guidelines

Non-Point Source	Potential	Risk
Agriculture, Urban, Forestry	High – No BMP, high pesticide use,	High – Immediate proximity of
	high livestock density, high density	surface water, high toxicity
	of forestry activities, high	and/or volume
	percentage of impervious surface,	Medium – Near main stem or
	hilly topography, abandoned mines,	major tributary, moderate
	visible signs of erosion or other	volume and/or toxicity
	water quality violations	<u>Low</u> – No surface water in close
	Medium – BMP in place but not	proximity, low or little volume
	always properly implemented,	and/or toxicity
	moderate livestock density,	
	moderate density of forestry	
	activities, moderate percentage of	
	impervious surface, moderate	
	topography, some buffers in place.	
1	Low – BMP in place and properly	
	implemented, low livestock density,	
	low density of forestry activities, low	
	percentage of impervious surface,	
	generally flat topography, buffer	***
	zones in place	

After determining the overall potential and risk using the weighted measures along with good judgment, each source is plotted on a chart in relation to the other sources with the axes representing the potential and risk as shown below:

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000) Release Potential Chart

^	(4)	(7)	(9)
High	High Risk	High Risk	High Risk
111911	Low Potential	Medium Potential	High Potential
	(2)	(5)	(8)
High	Medium Risk	Medium Risk	Medium Risk
Tingit	Low Potential	Medium Potential	High Potential
	(1)	(3)	(6)
High	Low Risk	Low Risk	Low Risk
Tilgit	Low Potential	Medium Potential	High Potential
			——
	Low	Medium	High

After all sources were charted, they were prioritized as follows:

High Priority:

Contaminant Sources located in Grid Squares 7,8, and 9

Medium Priority:

Contaminant Sources located in Grid Squares 4,5, and 6

Low Priority:

Contaminant Sources located in Grid Squares 1,2, and 3

High priority would be the pollutant sources to be addressed first in order to have the maximum impact on reducing the susceptibility of the drinking water intake to potential adverse effects.

Haralson County Surface Water Intakes-Bush Creek (WSID #1430000)

The overall susceptibility of the intake can be determined as follows:

High Susceptibility	40% or more of the sources chart in grid squares 7, 8, and 9	
Medium Susceptibility	20% or less of the sources chart in grid squares 7, 8, and 9 and 40%	
	or more of the grid squares chart in grid squares 4, 5, and 6	
Low Susceptibility	20% or less of the sources chart in grid squares 7, 8, and 9 and 20%	
	or less of the sources chart in grid squares 4, 5, and 6	

Results

Only one (1) potential pollutant fell in a priority class. It was a road that fell in the medium priority range. This means that this potential source do not warrant a significant level of concern. The overall susceptibility score for the Bremen Surface Water Intake (WSID #1430000) was **Medium**.

The results of the susceptibility determination are summarized in the following tables:

Pollutant Classes

Medium Priority	
Gordon St.	

Risk

High Medium Low

High Risk/Low Potential (1)	High Risk/Medium	Lligh Digly/Uigh Detection
right Risk/Low Potential (1)	Potential	High Risk/High Potential
Medium Risk/Low Potential	Medium Risk/Medium Potential	Medium Risk/High Potential
Low Risk/Low Potential	Low Risk/Medium Potential	Low Risk/High Potential
Low	Medium	High

Release Potential

Overall source water susceptibility score = Medium Susceptibility
